Animal Adaptations

To survive and reproduce, organisms have adaptations that make them suited to their environment. This programme looks at the structural, behavioural and physiological adaptations of some fascinating organisms including arctic foxes, echidnas, humpback whales and camels.

Six Common Body Plans

Life in the Sea explains the distinguishing features of the six most common phyla - from the basic body plans of sponges to the sophisticated anatomy of the chordates. The key points of each body plan are explained and how they equip their owners for survival. After watching this program, students will be able to classify the most common marine organisms at the phylum level.

Chromatography

Chemical analysis is integral to modern society. The testing of consumer goods, industrial products and food relies upon a number of different techniques. This program will investigate the analytical techniques of chromatography, mass spectrometry and spectroscopy.

Food Safety and Hygiene

Disease causing bacteria found on the human body and in unhygienic food preparation areas can be easily transmitted to those who consume the food. That's why food safety and hygiene is paramount in the prevention of food-borne illness.
